<b>Technology Utilized:</b>	<b>Excavation, Lead Removal, Transportation, and Disposal</b>

### **Project Description**

SEMS was contracted by Geo-Marine, Inc. to excavate lead contaminated soil from under and around an elevated water tower. Approximately 1,050 cubic yards of soil were removed. Approximately 960 cubic yards contained non-hazardous levels of lead. This material was transported to a permitted non-hazardous landfill. Approximately 90 cubic yards containing hazardous levels of lead were transported to a permitted hazardous landfill where it was stabilized prior to landfilling.

Upon completion of the excavation activities and receipt of confirmatory analytical results, the excavation area was backfilled with imported, clean fill and topped with a layer of imported topsoil. Hydroseeding completed the site restoration activities.
